

Do You Know *Where your balloons GO?*

They travel
thousands of miles...

their strong plastic ribbons become tangled in trees, poles, and electrical lines causing fires and power outages.

fall on land & sea,

littering land and coastal areas with plastic pieces that take years to breakdown. Micro and nano plastics are in the air we breathe, the food we eat, and water we drink.

meet up with wildlife,

that are caught tight in balloon ribbons wrapped around flippers and wings. They can't fly, swim or move and don't often survive.

and are eaten by
birds, and animals.

its easy for animals to think balloon pieces are jellyfish and eat them. Those bits become lodged in their intestinal track, leading to starvation.
